

## What's New at Aria Perio & Implant Group?

Dental surgery has always been a precision science. For years we have been utilizing Cone Beam CT scans in our treatment, but only recently have we purchased our own machine. The newest Morita Veraviewepocs 3D R100 has changed the shape of 3D full arch imaging. The CBCT scan allows us to correctly identify major anatomical structures (such as inferior alveolar nerve, floor of maxillary sinus, Lingual concavity in the mandible) and determine the dimensions of the remaining alveolar bone for placement of implant therapy. This allows us to plan and place implants digitally. This multifunctional unit offers panoramic and cephalometric imaging.

Different FOVs on the CBCT allows us to take images ranging from a small field to the entire maxillary and mandibular jaw. It allows us to fully plan all implants digitally. It also facilitates fully guided implants too. We have a Dose Reduction Mode which allows us to lower the exposure for easily penetrated tissues. This unit is available for all of your CBCT scans. Schedule your patient for your CBCT scan today, and we'll forward the final result on a USB drive, CD, or upload it online.

Veraviewepocs 3D R100 F40

your patient for your images today, and we'll forward the final result on a USB thumb drive, CD, or upload it online. We will work fully with our referring dentist to provide them with the required treatments.

### Services we provide

We provide full periodontal and implant therapy ranging from non-surgical and surgical periodontal treatments (including pocket reductions surgery, regeneration therapy, crown lengthening), Soft tissue Grafting (including root coverage and KT Augmentation), Canine Exposure, pre-prosthetic surgery, Extractions, Socket Preservation, Lateral Ridge Augmentation, Sinus Floor elevation, and implant placement (including immediate placement).

**We are also Certified providers of the Pinhole surgical technique for root coverage.** We monitor all the latest systems and techniques available to offer our patients all options for gum treatment. Dr. Nouri has completed the Chao Pinhole training program. This is a scalpel free, suture free, and graft free technique to correct gum recession.

Using specially designed instruments, we gently loosen the gum tissue and glide it over the receded part of the tooth. As there is no cutting or stitching, patients can expect minimal post-operative symptoms.

Ask us, or have your referred patients inquire if this treatment program is ideal for them.

## Referrals Now Available Online

Our referring dentists can now use our website as well. By referring online, once you submit the referral a copy of the referral will be emailed to you for your charts and records. See this link to utilize this option!

## What to Expect From Us!

Referring offices are the life blood of any successful periodontal practice. A full 100% of our patients arrive at Aria from our referring doctors, and 100% are returned to our referring doctors. Virtually no patient wakes up one day and decided to call a periodontist on their own. In fact, some patients arrive at our office (from a referral office) with not much of an idea why they are here!

We act as an extension of your practice. You deserve, and will receive, a written and detailed report of our diagnosis, treatment planned or completed, and accompanied by digital X ray or photographic record. In the event a copy of our CT scan is warranted, that shall be provided as well. If a paper copy demonstrates the situation adequately, that shall be sent. If an actual digital copy on a CD or a flash drive is required – that too shall be provided.

We never have, nor shall we ever 'keep' patients. There may be a situation where, after consultation with you, a referral needs to be made to other dental specialists. This is only ever made after consultation with our referring doctor. You will complete your case, based on our findings.

If you have any specific suggestions or reporting requirements for any or all of your referral charts, please let us know and we'll gladly comply!
